

## ASSIGNMENT 5.3

2303A51695

P. Nandhini

BATCH-28

### Ethical and Secure Use of AI-Generated Code

#### Task 1: Privacy and Data Security in AI-Generated Code

PROMPT: GENERATE A LOGIN CODE IN PYTHON

CODE AND OUTPUT:

The screenshot shows a code editor interface with a dark theme. On the left, there is a file named "main.py" containing the following Python code:

```
1 def login_basic():
2     username = input("Enter username: ")
3     password = input("Enter password: ")
4
5     if username == "admin" and password == "password123":
6         print("Login successful!")
7     else:
8         print("Invalid credentials")
9
10 login_basic()
```

On the right, there is an "Output" panel with the following text:

```
Enter username: pranavasai
Enter password: ramesh
Invalid credentials
== Code Execution Successful ==
```

There are several icons at the top of the editor: a file icon, a copy icon, a run icon, and a clear icon.

Security Issues Identified:

- Credentials are hardcoded
- Password is stored and compared in plain text
- No input validation or hashing

PROMPT: GENERATE A SECURE CODE

CODE AND OUTPUT:

The screenshot shows a code editor interface with a dark theme. On the left, there is a file containing the following Python code:

```
1 import getpass, hashlib
2
3 stored_hash = hashlib.sha256('securePass'
4     .encode()).hexdigest()
5 user_pass = getpass.getpass('Password: ')
6
7 if hashlib.sha256(user_pass.encode()
8     .hexdigest()) == stored_hash:
9     print('Login successful')
10 else:
11     print('Login failed')
```

On the right, there is an "Output" panel with the following text:

```
Password:
Login failed
== Code Execution Successful ==
```

Improvements:

- Removed hardcoded credentials
- Used password hashing
- Used secure password input

## Task 2: Bias Detection in AI-Generated Decision Systems

PROMPT:

Generate A Loan Approval Code (Biased Example):

CODE AND OUTPUT:

```
main.py
```

```
1 applicant_gender = "male"
2 income = 60000
3
4 if applicant_gender == "male" and income >
5     50000:
6     approve = True
7 else:
8     approve = False
9 print("Loan Approved:", approve)
10
```

Output

```
Loan Approved: True
== Code Execution Successful ==
```

Clear

Bias Identified:

- Approval depends on gender
- Gender is irrelevant to loan eligibility

Fairness Discussion:

Such logic unfairly disadvantages applicants based on gender.

Mitigation Strategies:

- Remove gender from decision logic
- Use only financial criteria
- Regular bias audits

### Task 3: Transparency and Explainability (Recursive Binary Search)

PROMPT: Generate a Recursive Binary Search Code:

<pre>main.py</pre>  <pre>1- def binary_search(arr, low, high, target): 2     # Base case 3     if low &gt; high: 4         return -1 5 6     mid = (low + high) // 2 7 8     # If element found 9     if arr[mid] == target: 10        return mid 11    # Recursive case: search left half 12    elif target &lt; arr[mid]: 13        return binary_search(arr, low, mid 14                                - 1, target) 15    # Recursive case: search right half 16    else: 17        return binary_search(arr, mid + 1, 18                               high, target) 18</pre>	<p>Output</p>  <pre>== Code Execution Successful ==</pre>	<p>Code and Output:</p>
---	--	-------------------------

Explanation:

- Base case stops recursion when search range is invalid

- Recursive case reduces problem size each call

Code is beginner-friendly, well-commented, and logically clear.

### Task 4: Ethical Evaluation of AI-Based Scoring Systems

PROMPT: Generate a Scoring Code:

CODE AND OUTPUT:

<pre>main.py</pre>  <pre>1 2 skills = float(input("Enter skills score: 3                         ")) 4 experience = float(input("Enter experience 5                           score: ")) 6 education = float(input("Enter education 7                           score: ")) 8 9 score = skills * 0.5 + experience * 0.3 + 10                    education * 0.2 11 12 print("Final Score:", score)</pre>	<p>Output</p>  <pre>Enter skills score: 15 Enter experience score: 34 Enter education score: 45 Final Score: 26.7 == Code Execution Successful ==</pre>
--	--

Bias Analysis:

- No gender or name used
- Logic is objective and skill-based

Ethical Evaluation:

Scoring is fair as it relies on job-relevant attributes.

### Task 5: Inclusiveness and Ethical Variable Design

PROMPT: generate a code for bonus based on if gender is male

CODE:

```
python

if gender == 'male':
    bonus = 1000
else:
    bonus = 500
```

Issues:

- Gender-based assumptions
- Non-inclusive logic

Revised Inclusive Code:

PROMPT: GENERATE A CODE BASED ON PERFORMANCE

CODE AND OUPUT:

```
1 # Input performance rating
2 performance_rating = float(input("Enter
    performance rating (1 to 5): "))
3
4 # Bonus calculation based on performance
5 if performance_rating >= 4:
6     bonus = 1000
7 else:
8     bonus = 500
9
10 # Output
11 print("Bonus Amount:", bonus)
12 |
13
```

```
Enter performance rating (1 to 5): 4
Bonus Amount: 1000
== Code Execution Successful ==
```

#### Improvements:

- Removed gender dependency
- Used performance-based logic
